The achicago BibTeX style A Chicago Manual BibTeX style

Matt Swift <swift@alum.mit.edu>

Version: 1 Date: 2001/08/31 Documentation revision: 2001/08/31

To do: explain conventions; put some in compsci

Abstract

Chicago Manual of Style bibliography style ${\tt BibT}_{\hbox{\scriptsize E}}{\tt X}$ macros.

Part I

Discussion

Warning: The dox are spotty for this bibstyle—sorry! This is a pretty stable style, however. I've included almost my entire test cases. If you're puzzled, you may compare frankenstein. bib with what you see in the References section at the end of this document. Or please write me.

Reference list ordering: alphabetical by author or whatever passes for author in the absence of one.

1 Pros and cons of this style

See a discussion in the documentation for the achicago package.

2 User documentation

No bibstyle is going to elgantly handle everything while using them in a way that's at all compatible with the majority of existing bibstyles out there. And it's not clear that such a bibstyle would be worth the effort to write and learn to use properly. The time would be better spent, I think, writing some macros to make inserting hand-done exceptions seamlessly into the bibliography, so that the whole process could remain clean and automatic.

For the sceptical, and for your entertainment, an example. I wanted to a cite a certain paper by Freud in my dissertation. The cited paper has a title, date of first publication, and chapter number; I read this paper in a volume of Freud's papers with a title, volume editor, volume date, publisher, reprint date, and reprint publisher; this volume has a number in a series of publications (The International Psycho-Analytic Library) with a series editor; and also this volume has a volume number within a multivolume work with its own title (Collected Papers) and (supervising) translator. Readers honestly don't need all that information, but each one of those 15 pieces of information might be highly important for another citation, for which only two or three pieces of information were relevant or available. No one needs to write a bibstyle that handles it all, so at several places, the fields are assumed to be used for either one thing or another. For example, '' series either contains the title of the inclusive multivolume work or the series. When, as rarely happens, a volume is part of both at once, you have to give up one or the other.

Warning: This is a complex bibstyle and the number of potential cases is very high. Please check your output, and write me with cases that are not set according to Chicago Manual percepts. Please refer to Chicago Manual whenever possible.

To do: star the new fields.

entry type	$\operatorname{description}$
address	Address of publisher of <i>cited</i> edition, whether a reprint or
	not.
annotation	A complete paragraph or more.

Table 1: Entry types.

entry type	description
author	*
bookauthor	Book's author whenever "author is referring to the author of a part of the book. Usually an 'inbook' or "incollection" entry refers to a book with an editor but no author, but in the case of introductions etc. you have an author for each.
booktitle	Book's title whenever '' title is referring to a part of the book.
chapter	The ''title names the ''chapterth part of the book. One expects to have nonempty ''booktitle. See also ''type.
edition	Edition information to be given after the book's title, which is "booktitle if that is nonempty and "title otherwise. Example: 2d~ed.,2~vols.in1~book
editor	miser Entempter 24 out, 2 volume 2001
Cartor	NOTE all f* and o* fields are only going to apply to 'book', "incollection", 'inbook' entries. FIX: check – booklet? etc.
faddress	Address of publisher of first-published edition. Not used unless "fyear is nonempty.
flanguage	Language of first-published edition. Not used unless '' translator or '' fyear is nonempty.
fpublisher	Publisher of first-published edition. Not used unless '' fyear is nonempty.
ftitle	Title of first-published edition (probably in '' flanguage). Not used unless '' fyear is nonempty.
fyear howpublished	Publication date of first-published edition.
illustrator	For 'book' entries only. When the author or editor illustrates, use a construction like {theeditor}andothers.
institution	For thesis entries only. FIX check
journal	For 'article' entries only.
key	often default with empty author, editor, organization
month	For 'journal' entries, also season, e.g., Winter
note	Begins its own block, so capitalize. Concluding puctuation is supplied automatically if not given in the field.
number	For 'journal' entry, number of the journal (if no "" volume) or number within the volume. For "book" entry, number of the book in the ''series. Makes sense only when ''series is a series rather than the title of a multivolume work.
oaddress	For a reprint, address of ORIGINAL publisher.
opublisher	For a reprint, publisher of ORIGINAL edition. A nonempty value implies the cited edition IS a reprint (and so must have '' oyear).
organization	
oyear	For a reprint, publication date of ORIGINAL edition A nonempty value implies the cited edition IS a reprint (and so OUGHT TO have '' opublisher). The value will almost always differ from '' year.
nagag	arways unier from year.
pages publisher	Publisher of the cited edition.

Table 1: Entry types.

entry type	$\operatorname{description}$
school	
series	Series to which '' title belongs, or title of a multivolume work where the volumes have their own titles given in '' booktitle or '' title.
seriesedition	Edition information to be given after "series. Makes sense only when "series is the title of a multivolume work with titled volumes. In the entry for the multivolume work, that is, when "series and "title are identical, use "seriesedition not "edition. See also "edition. Consequence of disobeying last is when references are less than min-crossrefs (i.e., no separate entry for the multivolume work) you get the edition information for the multivolume work appearing after the title of the component volume. Note: you can't really get away with putting a series editor here. I think you'd have to use the "note field for that; or we could make yet another field.
title	, , , , , , , , , , , , , , , , , , ,
translator	For 'book' entries only, the translator(s). See also "" flanguage. When the author or editor translates, use a construction like {theeditor}andothers.
type	For 'inbook' entries, the value overrides Chapter. When "" type is empty you get Chapter~ <chapter>of. FIX: CHECK: For *-thesis entries, gives thesis-type word, e.g. Master'sThesis.</chapter>
volume	For 'journal' entry, it's volume. For "book" entry, its number in the '' series, or its volume number in a multivolume book.
year	Year of publication of cited edition, whether a reprint or not.
yearcomp	Year work composed. For 'book' entry only (so far).

Table 1: Entry types.

Part II

Implementation

3 Version control

Version information:

```

```

4 Implementation

4.1 Define fields and variables

4.1.1 Global variables

output.state will have one of the four scalar values before.all, mid.sentence, after.sentence, and after.block, telling us where we are in producing the entry.

Achicago uses only blocks, not sentences, to delimit units in the bibentry (some other bibstyles use both). The achicago package defines \newblock to add a very small and rubber amount of horizontal space, relaxing somewhat the \frenchspacing in effect. I have not removed the programming structures that distinguish sentences and blocks, but I have not concerned myself with them either; anyone wishing to revise this style to begin using them should check their work carefully.

```
16 INTEGERS { output.state before.all mid.sentence after.sentence after.block }
```

The entry variable principal-type will have one of the five scalar values author.ptype, editor.ptype, organization.ptype, key.ptype, and emergency.ptype, telling us what type of information is in the principal field. See also the discussion of key.special.p.

```
17 INTEGERS { author.ptype editor.ptype organization.ptype key.ptype 18 emergency.ptype }
```

These are used during the forward and reverse passes to hold information about the previously-processed record.

```
19 INTEGERS { last.year.tag.num }
20 STRINGS { last.leaditem last.label.and.year following.year.label.tag }
```

These variables are used locally within various functions or function groups, where their particular use is documented.

To do: document which if any are used in a nonlocal way

Warning: Suspect a conflict among these scratch variables if a strange problem occurs! I think u is the only one that will hold its value past an output.

```
21 INTEGERS { j nameptr namesleft numnames len }
22 STRINGS { s t u v w }
```

4.1.2 Bibfields

The list of fields that will be examined in database records, if they exist. Fields in the bib database not on this list will be ignored. Not every entry type makes use of every field. Each entry type function below lists its required, optional, and ignored fields. Expected use of these fields is documented above in the user documentation.

```
23 ENTRY
24 { address

      volume
57
58
      year
      yearcomp
59
60
```

Entry variables have a per-record value but are not initialized from a field.

The integer principal-type will contain one of the scalars author.ptype, editor.ptype, etc. (see their declarations above for further information). principal-type is set in the function set.principal-field.principal-type.

```
61 { principal-type }
```

The strings label, year.label and year.label.tag are used to construct the citation (the running text at the location of the user's \cite command). In most cases, label will contain a string derived from the principal-field (see make.label).

```
62 { label
```

year.label will contain a string representing the date. It's not necessarily the same as "year (see make.year.label). year.label.tag will either be empty or be a lower-case letter, as determined in the forward and reverse passes.

```
63 year.label year.label.tag
```

principal-field will contain one of the fields, depending on entry type and what fields are nonempty (see set.principal-field.principal-type).

In most cases, leaditem will contain the principal-field properly formatted for apearance at the beginning of the bibliography entry (see make.leaditem). When it is identical to the previous entry's leaditem, it will be wrapped in \SCduplicate by the forward and reverse passes.

```
64 principal-field
65 leaditem
66 }
```

4.2 Define macros

These are macro abbreviations required by convention in every bibstyle. The user can redefine them with QSTRING declarations in the bib database.

```
67 MACRO {jan} {"January"}
68 MACRO {feb} {"February"}
69 MACRO {mar} {"March"}
70 MACRO {apr} {"April"}
71 MACRO {may} {"May"}
72 MACRO {jun} {"June"}
73 MACRO {jul} {"July"}
74 MACRO {aug} {"August"}
75 MACRO {sep} {"September"}
76 MACRO {oct} {"October"}
77 MACRO {nov} {"November"}
78 MACRO {dec} {"December"}
```

4.3 Debugging functions

```
85
86 FUNCTION {debugmsg}
87 { " in " * cite$ * top$
88 }
```

4.4 Initialization functions

init.scalars This should be called before any processing begins.

```
89 FUNCTION {init.scalars}
90 { #0 'before.all :=
    #1 'mid.sentence :=
91
92
    #2 'after.sentence :=
93
     #3 'after.block :=
94
95
     #0 'author.ptype :=
96
     #1 'editor.ptype :=
    #2 'organization.ptype :=
97
    #3 'key.ptype :=
98
    #4 'emergency.ptype :=
99
100 }
```

4.5 Boolean logic

```
not
and 101 \text{ FUNCTION } \{\text{not}\}
 or 102 {
              { #0
     103
              }
              { #1
     104
              }
     105
                                    %$
     106
           if$
     107 }
     108
     109 FUNCTION {and}
     110 {
              'skip$
                                    %$
     111
              { pop$
                                    %$
     112
                #0
     113
     114
           if$
                                    %$
     115 }
     116
     117 FUNCTION {or}
                                    %$
     118 {
              { pop$
     119
                #1
     120
     121
              'skip$
                                    %$
     122
           if$
                                    %$
     123 }
```

4.6 Constant functions

These definitions are made so that later functions are easier to read and so that adapting this bibstyle to another language will be simpler.

```
hyphen
colon
space
delimiter.name-part
delimiter.sub-sortkey
tie
etal
unidentified
```

comma

period

The reason these are functions not macros is so the user cannot change them.

```
124 FUNCTION {comma}
125 { ","
126 }
128 FUNCTION {period}
129 { "."
130 }
132 FUNCTION {hyphen}
133 { "-"
134 }
135
136 FUNCTION {colon}
137 { ":"
138 }
140 FUNCTION {space}
141 { " "
142 }
143
144 FUNCTION {delimiter.name-part}
145 { " "
146 }
147
148 FUNCTION {delimiter.name}
149 { "
150 }
151
152 \; {\tt FUNCTION} \; \; \{ {\tt delimiter.sub-sortkey} \}
153 { "
154 }
155
156 FUNCTION {tie}
157 { "~"
158 }
159
160 FUNCTION {etal}
161 { " et~al."
162 }
```

Below, we need to be able to set a string to a value which would never be generated from any string in a bibliography database. It's safe to assume that this string is such a one.

```
163 FUNCTION {unidentified}
164 { "HiGHlY*Peco@lIEr"
165 }
```

4.7 Output functions

The output function automatically handles interunit punctuation.

output should be called with a string and a punctuation mark on the stack. The punctuation mark is what should *precede* the string in the case the string begins in the middle of a sentence. Strings which begin sentences are preceded

by periods. Strings which begin a new block are preceded by periods and the **newblock** command. (It makes no sense for a string to begin at the end of a sentence.)

Calls to output.internal leave the string on the stack until the next time output.internal is called, when it will get written. The function output.begin puts an empty string on the stack, and should be called before beginning any series of calls to output. output.end cleans up and should be called at the conclusion of a series of calls to output.

output.begin Prepare for a series of calls to output. Put an empty string on the stack and set output.state to before.all.

```
166 FUNCTION{output.begin}
167 { ""
168 before.all 'output.state :=
169 }
```

output.end Conclude a series of calls to output. Simply calls write\$.

```
170 FUNCTION {output.end}
171 { write$ %
172 }
```

new.block Begin a new block.

new.sentence

Begin a new sentence. FIX: hmm, wouldn't we want to put a TeX command here for intersentence space now? Why do we mess with the usual spacefactor for periods anyway? When in bibliogrphies are the usual TeX rules not going to be what we want, and give too much space after a period? answer: when a lowercase letter followed by period, in e.g. sec. 2 and so on. often bibstyle will put tie there, but sometimes not I think, so need to have that be not an intersentence space. well, if i start using sentences instead of blocks, I think perhaps doing the same hskip after a sentence with a new command \newsentence perhaps as in \newblock would be the right thing to do.

output.internal \stackpunct string/entry(nonnull)null

```
187 FUNCTION {output.internal}
188 { 's := % s := string/entry(nonnull)
189 space * 't := % t := punctuation + space
190 output.state mid.sentence =
```

```
%$
        { t * write$
191
       }
192
        { output.state after.block
193
            { add.period$ write$
194
                                       %$
195
              newline$
              "\newblock " write$
                                                   %$
196
197
            }
198
              output.state before.all =
199
                 'write$
```

Final case is output.state = 'after.sentence', which means we just add a period, but no newline or \newblock command.

```
200 { add.period$ space * write$
201 }
202 if$ %$
203 }
204 if$ %$
```

We are now mid-sentence, whether we were before or not.

```
205 mid.sentence 'output.state := 206 } 207 if$ %$
```

The actual string given to 'output.internal' is left on the stack here for next time we call 'output.internal' or 'output.end', whichever comes next.

```
208 s
209 }
```

output \stackstring/entry puncteither null OR punct string/entry(nonnull)

Check if string/entry is null. If it's null do nothing. If it's nonempty call output.internal on it with the given punctuation.

output.bibitem

The optional argument to \bibitem will be made the definition of \b@foo where foo is the cite\$ key. \b@foo will be executed by all the various citing commands with a definition of \SCcite that is appropriate to each citing command.

The thebibliography environment actually ignores the optional argument to \bibitem. The environment sets the formatting so that the first part of the main entry hangs out to the left and looks like a label.

The unexpandable protection is necessary, instead of a simple protection, in order to work with newclude's tag option.

I guess we use write\$ for each part instead of catenating them and using a single write\$ in case the catenation gets longer than BibTEX can handle. I don't know, this is how I found it. It seems like catenation and a single call to write\$ would be faster. FIX.

```
218 FUNCTION {output.bibitem}
219 { newline$ %$
```

```
"\bibitem[\UnexpandableProtect\SCcite{" write$
                                                                 %$
220
     label write$
221
     "}{" write$
222
                                                  %$
     year.label year.label.tag * write$
223
     "}]{" write$
224
     cite$ write$
226
     "}" write$
                                %$
227
     newline$
                           %$
228 }
```

4.8 Simple auxiliary functions

field.or.null \stackfield literalfield contents or null string if the field was missing

italicize \stackstring or entrystring

Italicize the top string on the stack and provide italic corrections. Null goes to null. We want to explicitly italicize rather than use \emph, since semantic emphasis might be indicated in some other way in the document, e.g., slanted type.

```
237 FUNCTION {italicize}
238 { duplicate$ empty$
                              %$
        { pop$
239
240
241
242
       {
         "\textitswitch{" swap$ * "}" *
243
       }
244
     if$
                                  %$
245 }
```

 $\verb|parenthesize| \verb| \stackstring-or-entry:S"("+S+")"$

```
246 FUNCTION {parenthesize}
247 { duplicate$ empty$
        { pop$
249
        }
250
          "(" swap$ * ")" *
        {
                                       %$
251
       }
252
     if$
                                       %$
253
254 }
```

format.clip \stackstringstring FIX: the difference between entry.max\$ and global.max\$: max for an entry string, max for a global string.

format.clip \stackstring-Sstring-S-possibly-shortened

Clips a string down to the smaller of entry.max\$ and global.max\$.

```
255 \; \texttt{FUNCTION} \; \; \{\texttt{format.clip}\}
                       256 { #1 entry.max$ substring$
                       257 #1 global.max$ substring$
                       258 }
{\tt format.sortify.clip} \quad {\tt purify\$, downcase, and clip a string on the stack.} \\ {\tt \scale} \langle string \rangle \langle string \rangle \\
                       259 FUNCTION {format.sortify.clip}
                       260 { % duplicate$ "sinful" debugval %$
                       261 purify$
                                                          %$

tie.or.space.connect \stackstring stringstring

If the second string has less than 5 characters, the two are tied together, otherwise they are catenated with a space between them.

either.or.check \stackmsg fieldnull If field is not empty, give a warning appropriate for saying this field and an already-existing field can't be both used in the same entry.

4.9 Queue functions START FIXING DOX HERE

Queue functions expect a string on the stack. If it is empty, and the field for which the function is named is no empty, the string will be replaced with that field. (e.g., author.q will put 'author on the stack if 'author is nonempty and the author.q was passed an empty string). A chain of queue functions must begin with something on the stack, adn will leave the first nonempty field named in the chain on the stack.

Queue functions also increment an integer variable, 'j, whenever they are passed an empty string. At the end of the queue, 'j tells us which function in the queue contributed the string that results at the end of the queue, starting with zero for the first queue function after start.a.q. In order for this to work, queue functions must always be called in the same order: 'author ('#0') 'editor ('#1'), 'organization ('#2'), and 'key ('#3'). For entry types where a certain field should not appear in the queue, use 'blank.q' in its place in the order.

The value of j is consulted when setting leaditem, but not in other cases where queue functions are used

start.a.q must begin a queue. It initializes j and passes an empty string to the first queue function.

```
start.a.q

check.q \stackstring-S warning-stringstring-S

This should be the final queue command, though it is not a true queue command, since an extra warning string should be on the top of the stack above the string that has passed along the queue. The warning string should be an English disjunctive list of the queue commands that have come before it, so the user can tell which fields are missing. For example "author, organization, or key" if the queue has been author.q 'blank.q' 'organization.q' key.q.

If the queue string is empty, $\mathtt{check.q}$ issues the warning and puts on the stack an emergency string of the \mathtt{IATEX} key (i.e., $\mathtt{cite\$}$), which should allow \mathtt{BIBTEX} to proceed.

```
394 FUNCTION {check.q}
395 { 't :=
396
     duplicate$ empty$
                                                %$

404
     if$
405 }
```

4.10 Format functions dox

The format functions modify a string on the stack. They make no warnings, produce no output, and place no spaces or punctuation before or after their string, just modify it somehow.

4.11 Format names functions

format.names.for.label

Format string on stack it to produce something appropriate for label.

Comma usage examples in the *Chicago Manual*: "A et al." and "A, B, et al." The *Chicago Manual* recommends for labels: use up to 3 names, and above 3 use 1st + etal. When this would lead to ambiguity, use one of 3 solns: use all names, use as many as needed to disambiguate, or include a (short) title to disambiguate: (Zipursky et al., *Brief Title*, 1988).

The *Chicago Manual* does not appear to distinguish between "et al." and "and others". It's possible to change the logic here to distinguish between the cases where the bibstyle is truncating the list of authors, and the case where "and others" appears in the bib file. But I'm not doing that now.

Labels:

```
FIX: this stuff not implemented yet 1 author
2 authors
3 authors
4+ authors
Foo and Bar
Foo, Bar, and Baz
Foo et al.
Foo et al.
```

This function is probably more general than it needs to be, but it's a nice model.

```
406 FUNCTION {format.names.for.label}

4.12 Make functions

Make functions expect nothing on the stack, and leave one string there. Any side effects of setting global variables are noted in the comments. If a nonempty string cannot be made due to lack of the right fields, leave an empty one on the stack.

make.annotation Annotations can be omitted by nullifying the SCannotation environment.

```
508 FUNCTION {make.annotation}
509 { annotation empty$
        { ""
510
511
        }
         "\begin{SCannotation}"
512
          annotation *
513
          "\end{SCannotation}" *
514
515
        }
                     %$
516
     if$
```

make.edition We use some logic here because we want to use the "seriesedition for the "edition in certain cases.

```
518 FUNCTION {make.edition}
519 { edition empty$
                                        %$
        { seriesedition empty$ not series field.or.null title field.or.null = and
520
            { seriesedition
521
            }
522
            {
523
            }
524
          if$
                                                     %$
525
        }
526
527
        {
         edition
528
```

%\$

```
529 if$ %$ 530 }
```

make.year.month
make.year.nomonth

Make a year string. We don't we use year.label because that string is sterilized to make it appropriate for use in running text in citations (and for sorting I think); in the bibliography entry, we can be a little more lax, accepting special characters, and text that is not simply four numerals.

```
531 FUNCTION {make.year.month}
     { year empty$
                                        %$
532
533
          { ""
534
535

make.title.inquotes Put the title in quotes on the stack. \Wrapquotes is going to properly handle

punctuation that follows the closing quotation marks by sucking it inside the quotes. FIX: make generic function format.wrapquotes? like format.emphasize? FIX: make all those function that transform a string on the stack into "format" functions.

```
669 FUNCTION {make.title.inquotes}
670 { title empty$
        { ""
671
672
        }
673
          "\Wrapquotes{" title * "}" *
674
        }
675
     if$
                                                 %$
676
677 }
678 FUNCTION {make.pages}
                                     %$
679 { pages empty$
        { ""
680
        }
681
        { pages format.n.dashify
682
683
      if$
                                                    %$
684
685 }
```

ke.vol.series.num.month.pages

For articles, the number of cases to handle these fields is very large: 32 to do it properly! These cases could perhaps be collapsed, but it is going to be much easier to read here and to maintain if we do it brutishly by elaborating each case. The only exception I've made is when two adjacent leaves are very similar. The way I've laid out this funciton here, adjacent leaves are going to be the pairs of cases with and without a nonempty '' pages.

There are 5 relevant fields, each of which can be empty or not $(2^5=32)$. In the comments below, I mark each case with a series of 1 to 5 letters represent the cases where that field is nonempty: V for 'volume, S for 'series, N for 'number, M for 'month, and P for 'pages. Thus, the case marked with the comment SMP is the one where the 'series, 'month, and 'pages fields are nonempty, and 'volume and 'number are empty.

FIX: when I use make.pages in this function, it's slightly inefficient, since make.pages does a check for empty pages which is unnecessary here.

FIX: this does not yet handle entries with nonempty "series.

FIX: go through and combine adjacent leaves.

We could really put the punctuation that should precede this unit right at the beginning of the string we're making here, but let's conform better to the conventions and put this in the scratch variable 'u instead. I don't think this function will ever get called at any time other than mid-sentence, after the journal title, but who knows. So a call to this function should look like:

```
make.vol.series.num.month.pages u output
```

Remember that when output.internal writes the punctuation, it adds a space following, so it is unnecessary to begin the string this function returns with a space. (Occasionally below, we want (and produce) a colon followed by no space; we can do this because we are directly creating this string, not using the output routine.)

686 FUNCTION {make.vol.series.num.month.pages}

```
687\ \{ volume empty$
                                        %$

 ${\tt make.chapter.of}$

To say for example "Part 3" instead of "Chapter 3", put "Part" into the '' type field, and the number and the preposition into the '' chapter field, e.g., "3 of". A tie is automatically put in between the '' type field and the '' chapter field in this case. We can't make a decision based on the length of the '' chapter field when it's going to contain the preposition.

OK, putting the preposition in the chapter field doesn't work out when you do crossreferences. So let's try "of" as a general preposition.

```

4.13 Label and principal field functions

calc.labels rincipal-field.principal-type Set label and year.label from the original database. Set leaditem. For reference from above: "author ('#0') "editor ('#1'), "organization ('#2'), and "key ('#3').

FIX: NOTE: the entry-type functions (and specifically its subroutines like make.authors) are going to assume that bibentry contains the right field as calculated by

format the string on the stack based on the GLOBAL (not entry) variable j (= bibentry.type)

confusion here over terminology. bibentry and leaditem are the same thing, but it is also the basis for calculating the label. let's call the most important field for each type the PRINCIPAL field. this will be put into the lead position in the bibentry and also be massaged into the label. FIX: new idea, start using it leaves a string on the stack based on TYPE; the string is the first non-empty relevant field for the type, or an emergency substitution as supplied by check.q. FIX: end.the.q? would emergency be a 5th type that the format.principal-field functions should recognize?

Yes, check.q will put full cite-string on as emergency and set principal-type accordingly.

FIX: ensure proper warnings if we are not getting something good in principal-field.

or

that once before assignment to the sort.key.

Chicago Manual specifies all names should be given in the bibliography. FIX ref. So the Chicago Manual doesn't tell us how to handle the conventional "and others" that might be in the database. We handle it by proceeding on the assumption that "and others" always means the total names are more than 3, so we want to alphabetize these entries after all those with 1, 2, or 3 names. We do this by turning "and others" into a pseudo-name that will sort later than any real name (i.e., we insert a lot of z's).

The commented-out format is doing word-by-word alphabetization as defined §17.97 with the exception of hyphens. purify\$ turns hyphens into spaces, so hyphens are word boundaries, unlike slashes and apostrophes, which are suppressed. The *Chicago Manual* says hyphens should be supressed like slashes and apostrophes, so we need to remove them with format.dehyphen before we purify\$.

The *Chicago Manual* prefers letter-by-letter alphabetization, which is what the active code below does. We suppress spaces between tokens of a name part. We need to remove hyphens as explained above.

NOTE: We could therefore change our delimiters all down by one, since single space delimiters are no longer used, but I think there is no harm in starting with a 2-space delimiter, and this lets us change back and forth easily.

FIX: §17.100 names with initials in place of given names should precede those names which are spelled out. "J. Robert" before "James N." and "K. T." before "Keven S.". This is not consistent with the letter-by-letter method (it is with word-by-word). So, we want to insert a space after first-name tokens of length 1. How do we do that!?

FIX: do we need special handling for names with Saint, Mac, Mc, and M' $\S17.107{-}109?$

finish.entry Conclude an entry. \stackstringnull

4.15 Entry types

4.15.1 Article

article An article from a journal or magazine. Required: "author, "title, "journal, "year. Optional: "volume, "number, "pages, "month, "note. Title quoted.

FIX: this is not true any more. hmm, which warnings to give? Warnings given for no ''pages; no ''volume or ''number; and ''number but no ''volume. It's a drag, but the latter warning should remain there. The reason is that this bibstyle will produce a very misleading entry if you mistakenly omit the volume and give a number for a journal.

FIX: this is the old def of article, following output of title through end of crossref conditional.

```
volume field.or.null
     \end{macrocode}
  One item (the volume) is on the stack now. Each of the four cases in the
  following conditionals should leave a second item on the stack.
     \begin{macrocode}
      number empty$
        { volume empty$
            { "empty volume and number in " cite$ * warning$
              11 11
            }
            { colon
            }
          if$
                                 %$
        }
        { volume empty$
            { "number but no volume in " cite$ * warning$
%
     \end{macrocode}
```

```
\% FIX when a journal has no volume but a number, there should be a comma after
% the journal, a space and then ''no. n:ppp''. But we have already said
\% ''space output'' after the journal name, no doubt. So we have to make this
% decision earlier.
     \begin{macrocode}
              "\unskip, no." tie * number * colon *
            { "(" number * ")" * tie.or.space.connect
     \end{macrocode}
% FIX: I don't think this is handling the case without pages right -- there
\mbox{\ensuremath{\%}} will be a colon with nothing following. I could save either colon or
% colon+space in a variable, and slap it on before the pages if there are pages
\% and leave it off if there are no pages. Hmm, no: see \manaul 15.215
% for how to handle missing pages. Not easy.
% Now there's just one item (the volume) on the stack, so leave the following
% as the second item.
     \begin{macrocode}
              colon space *
          if$
        }
      if$ *
      make.pages "pages" check.empty *
      space output
      month parenthesize space output
```

A crossref from an article says "See this, pages xxx." See *Chicago Manual* 16:107 for this peculiar bit about the spacing after the colon.

```
1358 FUNCTION {article}
1359 { begin.entry
1360
     make.leaditem.with.tags space output
1361
     new.block

1368
          series empty$
1369
            'skip$
 FIX: take this out when we finish make.vol.series.
            { "Achicago can not yet handle nonempty series! in " cite$ * warning$
1370
1371
1372
          volume empty$ number empty$ month empty$ pages empty$ and and
1373
            { "empty volume, number, month, and pages in " cite$ * warning$
1374
```

See definition of make.vol.series.num.month.pages for why we set u in that function.

%\$

%\$

1375

1376

1377

}
'skip\$

if\$

```
1378 make.vol.series.num.month.pages u output
1379 }
```

Unusual case where you are probably citing one journal issue and numerous articles within it, so you have one entry for the issue itself, and others referring to it. Perhaps there are other cases, but I think what's right here is to give the crossref and only the pages.

4.15.5 Majorthesis

format.thesis thesis phdthesis mastersthesis Theses are all set in the same way, with a different type name. An entry with entry type 'thesis' ought to have a nonempty "" type. The other four alias entry types simply supply an explicit value for "" type, which are overridden by a nonempty "" type.

majorthesis FIX The "" type field should be hooked into a variable and done with the minorthesis babel package: \majorthesisname and so on.

```

```

```
1823    note "note" check.empty space output
1824    finish.entry
1825 }
```

4.15.13 Default

default.type I think BIBTEX is hardwired to look for this name.

```
1826 FUNCTION {default.type}
1827 { misc }
```

4.16 Sorting

I guess we don't bother calculating the length for efficiency's sake.

```
1828 FUNCTION {chop.word}
1829 { 't :=
     'len :=
1830
     t #1 len substring$ =
1831
        { t len #1 + global.max$ substring$
1832
        }
1833
        { t
1834
1835
        }
                         %$
1836
     if$
1837 }
```

make.title.for.sort We don't bother to format.sortify.clip, just do that once before assignment to the sort.key.

```
1838 FUNCTION {make.title.for.sort}
1839 { title field.or.null
1840
     't :=
      "A " #2
1841
        "An " #3
1842
1843
          "The " #4 t chop.word
1844
       chop.word
1845 chop.word
1846 % letter-by-letter alphabetization:
1847 format.dehyphen.dewhitespace
1848 }
```

presort Set label, year.label, leaditem. Set "sort.key\$ to leaditem + year.label + title suitably massaged.

Note that year.label.tag is not set yet; it will be set in stages in forward.pass.add.bcds and reverse.pass.add.as.

```

5 Disambiguating citations and sorting the bibliography

The initial calculation of citations can result in ambiguous labels for some entries. Two kinds of ambiguities can result:

same principal These are disambiguated by adding a unique lowercase letter to the end of the citations for each entry in the ambiguous set: (Smith 1980a) and (Smith 1980b); (Smith et al. 1970a), (Smith et al. 1970b). The order of the letters corresonds to the order of their appearance in the bibliography (see below).

different principal Different principals can have be (initially) given the same label in two cases: (1) the principals include 4 or more names and the initial names share a surname, and (2) the principals include the same number n < 4 of names and both the initial names and each of the subsequent names when present share a surname. In each case, the entries must also have the same year+tag, that is, the same year including any lowercase letters that might have been added. In both cases, ambiguous labels are disambiguated by adding first initials to those names which differ in the first name: (P. Smith 1980), (M. Smith 1980); (Green, Z. Black, and Meyer 1980), (Green, B. Black, and Meyer 1980); (Benson, Brown, Gray, White, B. Black, and Griscom 1900), (Benson, H. Brown, Gray, White, Z. Black, and Griscom 1900). When even first initials aren't enough to disambiguate, full names are used: (John D. Smith 1990), (John Q. Smith 1990); etc.

FIX: current behavior disambiguates all ambiguous citations by means of the lowercase letter. "A, B, C, and D 1999" together with "A, B, C, and E 1999" are going to resolve to "A et al 1999a" and 1999b. This nicely avoids disambiguation, but not what the Manual specifies.

FIX: current behavior is going to disambiguate citations that are ambiguous because authors share last but differ in first names by means of the lowercase letter: "Aa 1999" and "Ab 1999" become "Aa 1999a" and "Ab 1999b" (where 'A' stands for last name, and the 'a' right after it is the unmentioned first name). The Manual, however, specifies (16.3) disambiguating by using first initials in the label, such as "M. Brown 1999".

add.bcds: work on getting the right year.label.tag. Compare current entry's label plus year.label to the last entry's, which is stored in the global string variable last.label.and.year. If they are the same, increment global integer variable last.year.tag.num and set year.label.tag to the nth lowercase letter, where n is last.year.tag.num. If they are not the same, set last.label.and.year to the current label plus year.label, set year.label.tag to empty string, and set last.year.tag.num to 0.

After add.bcds pass, year.label.tag will be blank for all first entries of an ambiguous series, and "b," "c," etc. for second entries, third entries, and so on. The "a"'s will be added in the right places by the reverse.pass.add.as function.

Handle duplicate leaditems. Compare current entry's leaditem with the last entry's, which is stored in the global string variable last.leaditem. When they are the same, wrap the current entry's leaditem in \SCduplicate.

```
1906 FUNCTION {forward.pass.wrap.dupe.leaditems}
                    1907 { leaditem
