The nccmath package*

Alexander I. Rozhenko rozhenko@oapmg.sscc.ru

2005/02/21

The package extends the amsmath package adding some math commands from NCC-LATEX. It also improves spacing control before display equations and fixes a bug of ignoring the \displaybreak in the amsmath version of the equation environment. All options are passed to the amsmath package.

1 Improvement to the amsmath

eqnarray

In the amsmath package, the equarray environment leaves unchanged because alternative $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ environments exist. We redefine the equarray to work in the $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ style. The following improvements are done in it: an equation tag is prepared by the same manner as in $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ display formulas (\tag* and \tag* are allowed); the \displaybreak command is allowed; the intercolumn distance is reduced to

^{*}This file has version number v1.2, last revised 2005/02/21.

the distance between ordinary and relational math symbols; and the center field is prepared in the \displaystyle (the original version uses \textstyle here).

\intertext

The \intertext command is improved here. It now has an optional parameter:

```
\intertext[\langle distance \rangle] \{\langle text \rangle\}
```

The $\langle distance \rangle$ parameter specifies a vertical space inserted before and after the text. If it is omitted, standard T_EX's skips are inserted.

The following changes are made in display equations:

- The \displaybreak command now works within the equation environment (it is ignored in the amsmath);
- The $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ and \mathbb{I}^{\perp} display equations prepared in the vertical mode do not produce now an empty extra line before. Moreover, if a minipage starts from a display formula, the vertical skip before is suppressed.

2 Extra Macros

fleqn The following environments allow change the horizontal alignment of formulas ceqn inside them:

```
\begin{fleqn} [\langle \mathit{margin} \rangle] \dots \land \{fleqn\} \\ \begin{ceqn} \dots \land \{fleqn\} \\ \end{ceqn} \end{ceqn} \end{ceqn}
```

The fleqn environment prepares inner display equations in the flush left style. The $\langle margin \rangle$ parameter specifies the left margin value. If it is omitted, zero value is used. The ceqn environment prepares inner display equations in the centered style. They have no effect on formulas prepared with the low-level TEX command \$\$.

darray

The darray environment produces an array of formulas in the \displaystyle. The distance between formulas is enlarged in just the same manner as in other multiline display equations. The darray environment has the same syntax as the array:

```
\begin{darray}[\langle pos \rangle] \{\langle columns \rangle\} \\ \langle body \rangle \\ \begin{darray} \end{darray} \end{darray} \\
```

The $\langle pos \rangle$ argument describes the vertical alignment of the array box (t, b, or c; default is c). The use of column specifications in the $\langle columns \rangle$ argument is restricted in comparison with array: it can contain the 1, c, and r specifiers, * and @ commands. The intercolumn separation is smaller than in the array: it is reduced to the distance between ordinary and relational math symbols. As in the amsmath package, the thin skip is inserted before darray. Skips before the first and after the last column of darray are not inserted. To insert them manually, use @{...} in the $\langle columns \rangle$ argument.

The darray environment is implemented independently on the array environment to avoid conflicts with the array package.

\useshortskip

In TeX, two types of skips above display formulas are used: the normal skip defined in the \abovedisplayskip register and the short skip defined in the \abovedisplayshortskip register. When a display formula is typed out, TeX decides what skip to insert depending on the width of formula, its style (centered or flushed left, numbered left or right), and the width of the rest of text in the last line of the previous paragraph. But this algorithm works for ordinary formulas only. It does not work in multiline formulas prepared with \halign command. So, a manual replacement of the normal skip to the short skip is required in some cases. To provides this, the \usebluseshortskip command is introduced. It forces the use of short skip in the next display formula but it has no effect on formulas prepared with the low-level TeX command \$\$.

\nr

The vertical distance between lines of miltiline equations is frequently smaller than necessary. To increase it, the extra distance can be used as the optional parameter of the $\[(dist)\]$ command. In most cases, it is enough to increase the distance on 0.5ex. We introduce the \nr command here that is equivalent to the $\[0.5ex]$. Its full sintax is just the same as for the nr command:

$$*[\langle dist \rangle]$$

This command can be used everywhere the command \\ is allowed.

\mrel

\underrel

The \underrel{\langle base \rangle} \{\langle bottom \rangle} \text{ command is a twin to the \underrel command. For example, the command \$A\underrel{\longrightarrow}{x\to 0}B\$ produces $A \underset{x \to 0}{\longrightarrow} B$.

3 Medium-Size Math Commands

Since version 1.2, a collection of medium-size math commands is introduced.

\medmath

The $\mbox{medmath}{\langle formula \rangle}$ command decreases a size of formula in 1.2 times and prepares it in the display style. An example:

\$\medmath{\cfrac{1}{\sqrt 2 +\cfrac{1}{\sqrt 2 +\dotsb}}}\$
\quad \$\cfrac{1}{\sqrt 2 +\cfrac{1}{\sqrt 2 +\dotsb}}\$

It produces:

$$\frac{1}{\sqrt{2} + \frac{1}{\sqrt{2} + \dots}} \quad \frac{1}{\sqrt{2} + \frac{1}{\sqrt{2} + \dots}}$$

\medop

The $\mbox{\em medop}{\em command}$ command prepares a medium-size operator with the required preference for limits. It can be use with $\mbox{\em sum}$ and others variable-size commands except integrals. An example:

 $\sum_{i=1}^n \end{array} \sum_{i=1}^n \displaystyle \sum\\nolimits_{i=1}^n \quad \sum_{i=1}^n \displaystyle \medop\sum_{i=1}^n \sum_{i=1}^n$

It produces:

$$\sum_{i=1}^{n} \sum_{i=1}^{n} \sum_{i=1}^{n} \sum_{i=1}^{n} \sum_{i=1}^{n} \sum_{i=1}^{n}$$

\medint

The $\mbox{\sc medint}\{\mbox{\sc operator}\}\$ command prepares a medium-size integral with required preference for limits. It can be use with $\mbox{\sc int}$ -family of commands and $\mbox{\sc operator}$ and $\mbox{\sc operator}$. An example:

\$\int_a^b \medint\int_a^b \displaystyle\int_a^b\$\quad
\$\int\limits_a^b \medint\int_a^b\limits \displaystyle
\int_a\limits^b\$\quad \$\iint_a^b \medint\iiint_a^b
\displaystyle\iiiint_a^b\$\quad \$\iint\limits_X^Y
\medint\iiint_X\limits^Y \displaystyle \iiiint_X^Y\limits\$
\quad \$\medint\idotsint_X\limits \medint\oint_X^Y\$

It produces:

$$\int_a^b \int_a^b \int_a^b \int_a^b \int_a^b \int_a^b \int_a^b \int_a^b \int_a^b \int_{A}^b \int_{A}^$$

By the way, the original limits recognizing in amsmath multi-integrals is very restrictive: it allows only one \limits-like command right after the multi-integral. In this package, the recognizing is improved to work as TeX's one.

\medintcorr

The $\mbox{medintcorr}\{\langle length\rangle\}\$ command specifies the value of italic correction for medium integrals. It controls a positioning indices in medium integrals and in multi-integrals. Its default value is 0.5em.

\mfrac \mbinom Based on the medium size formulas, the \mfrac and \mbinom commands are introduced. They are similar to \frac and \binom. An example:

 $\frac{x+y}{a-b} \operatorname{xx+y}{a-b} \operatorname{xx+y}{a-b} \operatorname{xx+y}{a-b} \qquad \$ \\ \\ \dbinom \{n\{k\} \\ \dbinom \{n\{k\}\\$

It produces:

$$\frac{x+y}{a-b}\frac{x+y}{a-b}\frac{x+y}{a-b} \quad \binom{n}{k}\binom{n}{k}\binom{n}{k}$$

medsize mmatrix The medsize environment is introduced to prepare formulas and arrays in the medium size. It reduces the \arraycolsep value by 0.8 times. Basing on it, the mmatrix environment is introduced. It is specified as follows:

\begin{mmatrix} ... \end{mmatrix} \equiv
\begin{medsize}\begin{matrix} ... \end{matrix}\end{medsize}

An example:

\$\bigl(\begin{smallmatrix} a&b\\c&d\end{smallmatrix}\bigr)\$
\$\Bigl(\begin{smatrix} a&b\\c&d\end{smatrix}\Bigr)\$
\$\begin{pmatrix}a&b\\c&d\end{pmatrix}\$

It produces:

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

mediummath

Finally, the mediummath option allows prepare all variable-size math elements in medium size. It redefines \frac, \binom and all math operators to the medium size. For \frac and \binom, the medium size is applied in the display and text styles. The \dfrac, \tfrac, \dbinom, and \tbinom commands have the old meaning.

4 NCC-LATEX Equivalents to Display Formulas

The following NCC-LATEX equivalents are provided with this package:

The \eqs and \eqs* commands have an optional parameter specifying a distance between columns. For example, in the command

```
\egs[Omm]{\&\& -\Delta u = f, \ \&\& u|_\Gamma = 0,}
```

the intercolumn distance is removed because only the 3rd column is used. The eqnarray environment has no optional parameter.

The \eqalign and \eqalign* commands also have an optional parameter. Its meaning is the column specification parameter: \eqalign{ $\langle formulas \rangle$ } = \eqalign[rcl]{ $\langle formulas \rangle$ }.

5 The Implementation

At first we load the amsmath package and pass all options to it except the mediummath option.

- 1 (*package)
- 2 \DeclareOption{mediummath}{\newcommand\NCC@op{}}
- 3 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{amsmath}}
- 4 \ProcessOptions\relax
- 5 \RequirePackage{amsmath}[2000/07/18]

5.1 Kernel

Simplified version of \\ used in some commands here. The low level command \NCC@cr $\NCC@cr@@(\langle skip \rangle)$ is defined if necessary to $\NCC@aligncr$ or to something else. The \new@ifnextchar commands from the $A_{\mathcal{M}}S$ does the same as \@ifnextchar, but disallows spaces before the tested symbol. 6 \newif\ifNCC@star 7 \def\NCC@cr{\relax\iffalse{\fi\ifnum0='}\fi \@ifstar{\global\NCC@startrue\NCC@cr@}{\global\NCC@starfalse\NCC@cr@}% 9 } 10 \def\NCC@cr@{\new@ifnextchar[\NCC@cr@@{\NCC@cr@@[\z@]}} $11 \end{fine} $$11 \end{fine} iffalse} in CC@cr@@{#1}}$ 12 \def\NCC@aligncr#1{\cr\noalign{\vskip #1\relax}} \NCC@default@cr This command sets defaults for the \\ command. 13 \def\NCC@default@cr{\let\\\NCC@cr \let\NCC@cr@0@\NCC@aligncr} \mr The \mr command has just the same syntax as \\ but adds 0.5ex extra vertical space between lines. It can work anywhere the \\ command is allowed. We temporary change in it the value of \NCC@cr@@@ to \NCC@nr and restore it later. $14 \newcommand{\nr}{%}$ \let\NCC@temp\NCC@cr@@@ \let\NCC@cr@@@\NCC@nr 17 \NCC@cr 18 } 19 \def\NCC@nr#1{% \let\NCC@cr@@@\NCC@temp 20 \setlength\@tempskipa{#1}\advance\@tempskipa .5ex \ifNCC@star 22 \edef\@tempa{\noexpand*[\the\@tempskipa]}% 23 24 \else \edef\@tempa{\noexpand\\[\the\@tempskipa]}% 25 26 \fi \@tempa 28 } 5.2**Additional Math Commands** The $\mathbf{mrel}\{\langle column\rangle\}\$ command composes a new math relation and vertically centers it with respect to the math line. 29 \newcommand{\mrel}{\mathpalette\NCC@rel} \offinterlineskip \ialign{\hfil\$\m@th#1##\$\hfil\cr#2\crcr}}}

5.3 Medium-Size Math Commands

\NCC@select@msize

The \NCC@select@msize command prepares dimensions for medium-size math:

- In \NCC@fracrulewidth a rule width in fractions;
- In @tempdima a raising value; and
- In @tempdimb a font size to be used in medium fractions and matrices.

```
33 \newdimen\NCC@fracrulewidth
```

34 \def\NCC@select@msize{\relax

\Otempdima contains the current font size

35 \@tempdima \f@size\p@

Calculate in \Otempdimb a text font size in medium fraction

```
36 \ifdim\@tempdima>11.5\p@
37 \@tempdimb .83\@tempdima
38 \else
39 \@tempdimb .8\@tempdima
40 \ifdim\@tempdimb<5\p@ \@tempdimb 5\p@\fi
41 \fi
```

Calculate in \CCQfracrulewidth the rule width and in \Qtempdima — the raising value

\NCC@innerfrac

The $\NCC@innerfrac{\langle style \rangle}$ prepares a fraction with a special width in the given style:

 $50 \end{area} $10 \end{area} NCCOfracrule width \end{area} $10 \$

\NCC@prepare@msize

Select a font by rounding its pt-size to the nearest integer and redefine fractions to have the given rule width. The \binom command is redefined also to its original value because it can be changed when the mediummath option is applied.

```
51 \ensuremath{\mbox{\sc 0prepare 0msize}} \%
```

- 52 \@tempdima 1.2\@tempdimb
- 53 \advance\@tempdimb .5\p@
- $\tt 54 \verb| | \def|@tempa{\strip@pt|@tempdimb}| %$
- 55 \expandafter\NCC@floor\expandafter\@tempa\@tempa.\@nil
- 56 \fontsize\@tempa\@tempdima\selectfont
- 57 \def\frac{\protect\NCC@innerfrac{}}%
- 58 \def\dfrac{\NCC@innerfrac\z@}%
- 59 \def\tfrac{\NCC@innerfrac\@ne}%

```
60 \def\binom{\protect\genfrac()\z@{}}%
61 }
62 \def\NCC@floor#1#2.#3\@nil{\def#1{#2}}
```

\NCC@op@prepare

\NCC@op@prepare{\(\integral\)} command prepares an integral. It looks forward, extracts indices and limits-change commands, and puts the integral with required kerning of indices. The \NCC@op@print driver is a command to print the integral. Its default value is \NCC@op@printm. The driver uses the following hooks: \NCC@op contains an integral command, \NCC@op@lim contains the selected limits-style, \NCC@op@sb contains a subscript, \NCC@op@sp contains a superscript, \NCC@op@kern contains the kerning value for medium-size integrals. If subscript or superscript is omitted, the corresponding hook is equal to \relax.

```

             140 }
   \medmath The \medmath{\langle formula \rangle} prepares a medium-size formula in display style:
             141 \DeclareRobustCommand*\medmath[1] {\NCC@select@msize
                   \mathord{\raise\@tempdima\hbox{\NCC@prepare@msize
             143
                     $\displaystyle#1$}}%
             144 }
     \medop The \medop{\langle operator \rangle} prepares an operator in the medium size:
             145 \newcommand*\medop[1]{\DOTSB\mathop{\medmath{#1}}}\slimits@}
\medintcorr The \medintcorr{\langle length \rangle} specifies an italic correction for a medium integral:
             146 \verb|\newcommand*\medintcorr[1]{\def\nCC@op@kern{#1}}|
             147 \medintcorr{.5em}
    \medint The \medint{\langle integral \rangle} command prepares a medium integral:
             148 \newcommand*\medint[1]{\DOTSI\NCC@op@prepare{\medmath{#1}}}
      \mfac The \mfrac{\langle numerator \rangle}{\langle denominator \rangle} prepares a medium-size fraction:
             149 \DeclareRobustCommand*\mfrac[2]{\medmath{\frac{#1}{#2}}}
    \mbinom The \mbinom{\langle numerator \rangle}{\langle denominator \rangle} prepares a medium-size binomial ex-
              pression:
             150 \DeclareRobustCommand*\mbinom[2]{%
                   \label{lem:bigl(medmath{\genfrac{}}{}{z0}{}{#1}{#2}}\Bigr)\%
             151
             152 }
            The medsize environment is useful for preparing medium-size arrays:
    medsize
             153 \newenvironment{medsize}{\NCC@select@msize
                  \mathord\bgroup
                     \raise\@tempdima\hbox\bgroup\NCC@prepare@msize
             155
                       \arraycolsep .8\arraycolsep $}{$\egroup\egroup}
             156
    mmatrix The mmatrix environment prepares a medium-size matrix:
             157 \newenvironment{mmatrix}{\medsize\begin{matrix}}{\end{matrix}\endmedsize}
```

Patches to amsmath 5.4

\MultiIntegral Improve the \MultiIntegral kerning method on the base of \NCC@op@prepare@ hook. The original method from amsmath works bad if a multi-integral is an argument of the \medint command.

158 \renewcommand*{\MultiIntegral}[1]{%

\endmathdisplay@a

Fix the bug in the \endmathdisplay@a command from the amsmath package. The \displaybreak has no effect in it if a tag is specified. This is because the change of \postdisplaypenalty is done after the \eqno command. But the rest of display formula after \eqno up to the \$\$ command belongs to the tag. It is prepared in the horizontal mode and the mentioned penalty is ignored. Fixed version of this command at first changes the \postdisplaypenalty and after that prints a tag.

To be sure, that the required command does not fixed yet, we prepare its bug version in the **\Qtempa** command

```
191 \def\@tempa{%
192 \if@eqnsw \gdef\df@tag{\tagform@\theequation}\fi
193 \if@fleqn \@xp\endmathdisplay@fleqn
194 \else \ifx\df@tag\@empty \else \veqno \alt@tag \df@tag \fi

219 \fi
```

\intertext

Redefine $\mathcal{A}_{\mathcal{M}}\mathcal{S}$'s \intertext{\langle text\rangle} to \intertext[\langle skip\rangle] \{\langle text\rangle}. Optional \langle skip\rangle means the vertical space inserted below and after the text. If it is omitted, the default \belowdisplayskip and \abovedisplayskip spaces are inserted.

We need to redefine its default value used out of display equations:

220 \renewcommand*{\intertext}[1][]{\@amsmath@err{\Invalid@\intertext}\@eha} and also must redefine the \intertext@ hook that changes the value of \intertext within display equations. Its new definition differs from the original one in the conditional inserting of skips before and after the text. The optional parameter is scanned inside the \noalign command. We use the ordinary trick with the \ifnum0 to close the open brace in the next macro.

```
221 \def\intertext@{%
222
     \def\intertext{%
223
       \ifvmode\else\\\@empty\fi
224
       \noalign{\ifnum0='}\fi
225
         \@ifnextchar[{\NCC@intertext}{\NCC@intertext[]}%
226
     }%
227 }
228 \def\NCC@intertext[#1]#2{%
     \penalty\postdisplaypenalty
229
     \@ifempty{#1}{\vskip\belowdisplayskip}{\vskip#1\relax}%
230
231
     \vbox{\normalbaselines
232
       \ifdim\linewidth=\columnwidth
       \else \parshape\@ne \@totalleftmargin \linewidth
233
234
```

```
235
       \noindent#2\par}%
236
     \penalty\predisplaypenalty
     \@ifempty{#1}{\vskip\abovedisplayskip}{\vskip#1\relax}%
237
     \ifnum0='{\fi}%
238
239 }
```

\useshortskip The \useshortskip command changes an above skip for nearest display formula to \abovedisplayshortskip. Really, it sets the value of inner if-macro to true and the actual changes are applied in the \NCC@ignorepar hook.

```
240 \newif\ifNCC@shortskip \NCC@shortskipfalse
241 \ensuremath{\tt lower} {\tt lobal\ensuremath{\tt NCC@shortskiptrue}}
```

\NCC@ignorepar

This command removes extra vertical space before display formula if it starts from a new paragraph and changes the before-skip to \abovedisplayshortskip if the \useshortskip command was applied.

```
242 \def\NCC@ignorepar{\relax
     \ifNCC@shortskip
243
       \abovedisplayskip\abovedisplayshortskip
244
       \global\NCC@shortskipfalse
245
246
     \ifmmode \else \ifvmode
```

If a display equation starts in the vertical mode, we insert the vertical space with the \addvspace (this space will be ignored at the beginning of minipage) and set above display skips to zero. The below display skips are made equal. Then we put the \noindent command that prevents insertion an empty paragraph.

```
\addvspace{\abovedisplayskip}%
248
       \abovedisplayskip\z@skip
249
       \abovedisplayshortskip\z@skip
250
       \belowdisplayshortskip\belowdisplayskip
251
252
       \noindent
253
     \fi\fi
254 }
```

Now we insert the \NCC@ignorepar command at the beginning of all LATEX and $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -IATEX display equations except eqnarray. We need to correct four $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ commands only:

```
255 \let\NCC@startgather\start@gather
256 \let\NCC@startalign\start@align
257 \let\NCC@startmultline\start@multline
258 \let\NCC@startdisplay\mathdisplay
259 \def\start@gather{\NCC@ignorepar\NCC@startgather}
260 \def\start@align{\ifingather@\else\NCC@ignorepar\fi\NCC@startalign}
261 \def\start@multline{\NCC@ignorepar\NCC@startmultline}
262 \def\mathdisplay{\NCC@ignorepar\NCC@startdisplay}
```

5.5 The darray Environment

darray The implementation of darray is a hybrid of the \start@aligned command from the amsmath package and the \array command.

```
263 \newenvironment{darray}[2][c]{%
264
     \null\,%
     \if #1t\vtop \else \if#1b \vbox \else \vcenter \fi \fi
265
266
     \bgroup
       \NCC@default@cr
267
       \spread@equation
268
       \NCC@mkpream{#2}%
269
       \edef\@preamble{\ialign \bgroup \strut@ \@preamble \tabskip\z@skip \cr}%
270
       \let\par\@empty \let\@sharp##%
271
       \set@typeset@protect
272
       \tabskip\z@skip
273
274
       \@preamble
275 }{%
276
       \crcr\egroup\egroup
277 }
```

\NCC@mkpream

The darray environment is independent from array to avoid conflicts with packages customizing the array environment. So, we need to implement an independent preamble maker.

The following classes can appear in the preamble:

- $0 \, \mathrm{lcr}$
- 1 **@**-argument
- 2 @

The implementation of preamble maker is very similar to the LATEX's version.

```
278 \def\NCC@mkpream#1{%
```

279 \@lastchclass\@ne \@firstamptrue

Specify the default distance between columns in the $\alignsep@$ register from amsmath.

- 280 \settowidth\alignsep@{\$\m@th\mskip\thickmuskip\$}%
- 281 \let\@sharp\relax
- 282 \let\@preamble\@empty

The \@xexpast command expands the argument replacing all instances of $\{\langle N \rangle\}\{\langle string \rangle\}$ by $\langle N \rangle$ copies of $\langle string \rangle$. The result is saved in the \reserved@a macro. But this command is let to \relax in the array package. So, we use its original definition prepared in the \NCC@xexpast macro to avoid conflicts with other packages.

- 283 \let\protect\@unexpandable@protect
- 284 \NCC@xexpast #1*0x\@@

Now we make the preamble collecting it in the \@preamble hook. The code is very similar to the LATEX's \@mkpream command.

285 \expandafter \@tfor \expandafter \@nextchar

```
\expandafter :\expandafter =\reserved@a \do
              286
              287
                    {\@chclass
              288
                     \ifnum \@lastchclass=\tw@ \@ne \else

5.6 NCC Equations

```
fleqn The implementation of these environments is streightforward: change the \ifOfleqn
           ceqn flag and the \@mathmargin value:
                      331 \newenvironment*{fleqn}[1][\z0]{\Ofleqntrue
                                 \verb|\colored]{#1} \leqslant $$ \colored \ensuremath{\colored}{$} \colored \ensurem
                      333 }{%
                                 \ignorespacesafterend
                      334
                      335 }
                      336 \newenvironment{ceqn}{\@fleqnfalse
                                \@mathmargin\@centering \ignorespaces
                      337
                      338 }{%
                                \ignorespacesafterend
                      339
                      340 }
             \eq The implementation of the NCC-LATEX's \eq command is quite simple:
                      341 \end{\operatorname{\eq}}{\operatorname{\end}}{\operatorname{\end}}
                      342 \def\NCC@eqx#1{\begin{equation*}#1\end{equation*}}
                      343 \end{NCC@eq#1{\begin{equation}#1\end{equation}}}
  \eqalign The \eqalign command is based on the equation and darray environments:
                      344 \newcommand{\eqalign}{%
                                \@ifstar{\let\@tempa\NCC@eqx \NCC@eqa}%
                      345
                      346
                                                   {\let\@tempa\NCC@eq \NCC@eqa}%
                      347 }
                      348 \mbox{ \newcommand}*{\NCC@eqa}[2][rcl]{%}
                                \@tempa{\begin{darray}{#1}#2\end{darray}}%
                      350 }
           \eqs The difference between the \eqs command and the eqnarray environment consists
  eqnarray in optional length parameters allowed in \eqs. All these commands are based on
                        \NCC@beqs and \NCC@eeqs macros.
                      351 \newcommand{\eqs}{\@ifstar{\st@rredtrue\NCC@eqs}{\st@rredfalse \NCC@eqs}}
                      352 \newcommand*{\NCC@eqs}[2][]{%
                                \begingroup\NCC@beqs{#1}#2\NCC@eeqs\endgroup\ignorespaces
                      353
                      354 }
                      355 \renewenvironment{eqnarray}{\st@rredfalse\NCC@beqs{}}
                                                                                        {\NCC@eeqs\ignorespacesafterend}
                      357 \renewenvironment{eqnarray*}{\st@rredtrue\NCC@beqs{}}
                                                                                          {\NCC@eeqs\ignorespacesafterend}
\NCC@beas
                       The \NCC@beqs\{\langle skip \rangle\} starts equarray-like equations. The \langle skip \rangle parameter spec-
                        ifies a skip inserted between columns. If it is empty, the default value of this skip
                        is used. It equals to the thick skip appearing in relations. The implementation of
                        this macro uses hooks from the amsmath package.

\NCC@eqcr The \NCC@eqcr hook is called at the end of line of the eqnarray. It is originated
          on LATEX's \@eqncr command, but uses commands from amsmath to prepare a tag
          in the \mathcal{A}_{\mathcal{M}}\mathcal{S} style.
         376 \def\NCC@eqcr{%
         377
